Course Faculty: Dr. V.Jayasudha

Project Title: Smart AutoCare: A C-Based Vehicle Service and Billing Management System

Team contribution:

1.K.Thilagavathi (192312301)

2. C. Usha rani (192312304)

3. Harisha S K(192312311)

Project Description

Auto Care Pro: Automobile Workshop Service Management System in C

Auto Care Pro is a menu-driven C-based application designed to streamline the day-to-day operations of an automobile service workshop. The system provides a computerized method for managing customer details, vehicle information, service activities, and billing records. It reduces the dependency on manual registers by enabling users to create, view, search, and update workshop records efficiently. The application also supports service-history maintenance, expense calculation, bill generation, service-cost-based sorting, and preparation of daily workshop reports. File handling is incorporated to store and retrieve records for future use. The project demonstrates the practical application of C programming concepts including structures, functions, arrays, pointers, searching, sorting, and file management.

My Contribution

Customer, Service & Billing Operations

I was responsible for developing the Customer Records, Service Tracking, and Payment Management functionalities of the system. My work involved creating structured data models to store customer and vehicle details and implementing functions to add, display, search, and update service-related records. I developed efficient search operations to retrieve vehicle and customer information when required and implemented mechanisms for maintaining accurate service history. I also contributed to the billing module by calculating service charges, combining multiple expenses, and determining the total payable amount. These functionalities improved the accuracy of workshop records and provided a more organized approach to service and payment management.
